Strategy Information

The AMC offers participation in the outcome of a systematic trading strategy for long-term US Treasuries. It is an opportunistic quantitative approach that takes long or short positions according to specific price constellations (patterns) that promise a statistical advantage. On average, the system will trade 35 times per year with an average holding period of 2 days, which classifies it as a short-term trading strategy. The AMC employs a tactical asset allocation approach, maintaining market exposure approximately 20% of the time. The trading strategy is the intellectual property of VERTICA AG. It is traded through Interactive Brokers by the AMC Asset Manager. Instruments: The only instruments are T-bond futures on CBOT and/or highly liquid ETFs in the same area (e.g. TLT). For currency hedging, the portfolio will use FX cash or futures (EUR/USD).

No leverage is used. However, the strategy will also take short positions. Due to the characteristics of this strategy, it will have significantly lower volatility (lower risk) than any US Treasuries benchmark.

The objective of the product is to provide a substitute or complement for any bond portfolio with a very low correlation to its benchmark and a Sharpe Ratio well above 1 (i.e. gain 10% p.a., volatility 7% p.a.). The AMC provides daily liquidity.
